Preventive General blockers

4.2. Use in patients with impaired hepatic function: Amlodipine is correlated with degree of metabolism. In case of jaundice, the treatment must be withdrawn.

4.3 Contraindications

- Amlodipine (besylate) is contraindicated in patients with:
  - Hypersensitivity to amlodipine or its excipients.
  - Idiopathic hypertrophic subaortic stenosis (IHSS).
  - Angle-closure glaucoma.
  - Patients who have experienced a resistant myalgia syndrome.
  - Patients with biliary tract disease.
  - Patients with uncontrolled hypertension.

- Dried maize starch.

- Gelatin.

- Lactose.

- Magnesium stearate.

- Sodium stearyl fumarate.

- Titanium dioxide.

- Tricalcium phosphate.

- Zinc stearate.

- Imipramine (5mg) once daily is also contraindicated in case of combination therapy.

- Cimetidine.

- Verapamil.

- Diltiazem.

- Nifedipine.

- Amlodipine concentrations are not correlated with degree of hepatic metabolism.

- Amlodipine is contraindicated in patients who are taking cyclosporine, in whom amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking other calcium channel blockers, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.

- Amlodipine is contraindicated in patients who are taking verapamil, diltiazem, and nifedipine, as amlodipine may cause serious adverse reactions including angina and myocardial infarction.
