This card contains select important safety information that you need to know before and during treatment with Humira

- Keep this card with you at all times and for 70 days after your last injection of Humira
- Show this card to any doctor or health care professional that you see
- Record information about any tuberculosis tests or treatment you have had on the back of this card.

Introduction

Humira is a medicine that is intended to treat certain diseases that affect a part of the immune system. While Humira can be effective in treating these diseases, some people can have one or more side effects. It is important to talk to your doctor about the possible benefits and possible side effects of taking Humira. These can be different for each person.

- The purpose of this card is to tell you about some of the possible side effects of Humira
- Some of the serious side effects that could occur include infections, cancer, and nervous system problems
- These are not all of the possible side effects of Humira

Before Humira Treatment

Tell your doctor about any health problems you have and any medicines you take. This will help you and your doctor decide if Humira is right for you.

Tell your doctor if you:

- Have an infection or have symptoms of an infection (such as fever, wounds, feeling tired, dental problems)
- Have tuberculosis or have been in close contact with someone with tuberculosis
- Have or have had cancer
- Have any numbness or tingling or have a problem that affects your nervous system, such as multiple sclerosis

Your doctor should check you for signs and symptoms of tuberculosis before starting Humira. You may need to be treated for tuberculosis before you start Humira

Vaccinations

- You may receive vaccinations, except for live vaccines
- If you receive Humira while you are pregnant, it is important that you inform your baby's doctor before your baby receives any vaccine. Your baby should not receive a 'live vaccine', such as BCG (used to prevent tuberculosis) within 5 months following your last Humira injection during pregnancy

During Humira Treatment

To make sure that Humira is working properly and safely for you, you should check in with your doctor regularly to discuss how you are doing. Tell your doctor right away about any changes in your condition.

Keep your doctor informed about how Humira is working for you.

- It is important to call your doctor right away about any unusual symptoms you may have. This will help make sure you get the right care. It will also lower the chance of a side effect becoming worse
- Many side effects, including infections, can be managed if you tell your doctor right away
- If you get a side effect, your doctor will decide if you should continue or stop your Humira treatment. It is important to talk with your doctor to find out what is right for you
- Since side effects can happen after your last dose of Humira, tell your doctor about any problems that you may have up to 70 days after your last injection of Humira

Tell your doctor about:

- Any new medical conditions that you have
- New medicines you are taking
- Any surgery or operation that you have planned

Some people taking Humira may get serious side effects, including:

Infections

- Humira helps people with certain inflammatory diseases. It does this by blocking a part of the immune system. However, this part of the immune system also helps fight infection. This means Humira can make you more likely to get infections or make any infection that you may have worse. This includes infections such as colds or more serious infections like tuberculosis

Cancer

- If you take Humira, the risk of getting certain types of cancer may increase

Nervous system problems

- Some people have developed new or worsening nervous system problems with Humira. This includes multiple sclerosis

Please read the Humira package leaflet for more information. These are not all of the possible side effects that may occur during treatment with Humira.
